Manufactured and Warranted by SolidRF Technology Inc. Canada
www.SolidRF.ca
1. The outdoor unit catches the signal from the tower.
2. The outdoor unit amplifies the signal and sends it to the indoor unit through a coax cable.
3. The indoor unit rebroadcasts the signal indoors to all mobile devices within range.
4. The system also works in reverse; amplifying outgoing signal back to the tower.

⚠️ The size and the coverage area and the strength of the boosted signal are directly related to two key factors:
1. Signal strength received by the outdoor unit. So, setting up the outside unit where the signal is the strongest will provide the best results.
2. Distance of separation between the outdoor unit and the indoor unit.

### Package Contents

The SpeedPro kit includes the following items:
1. Outdoor unit (with mounting pole);
2. Indoor unit;
3. Power supply;
4. 45 ft of LM240 cable, for connecting the outdoor unit and indoor unit;
5. 15 ft of LM240 extension cable, with connector;
**Signal transmission loss and power level**

**Coverage area ability**

**Note:** FCC regulations limit the amplification of all cell phone boosters in order to prevent damage to the telecommunications infrastructure. Therefore, the maximum coverage area of a booster depends on the original power level of the signal captured by the outdoor unit.

⚠️ **Notice:** Not recommended when outdoor signal strength is less than -110dbm(3G/1x) or -120dBm(4G/LTE). The resulting coverage area of the boosted signal will be prohibitively small.

Find a cell tower nearby!
There are a variety of resources available online, here are some third party websites and app recommended. Use these to locate your nearest cell tower, either by street address of GPS coordinates.

For U.S. websites:
www.antennasearch.com/
www.cellmapper.net/
www.cellreception.com/towers

For Canada website:
www.cellmapper.net/

APP: Tower Locator (iPhone or Android)

Find The dBm Reading On Your Phone

Having an accurate measurement of signal strength in decibels (dBm) is crucial when installing your system. Decibels accurately measure the signal strength you are receiving. Test both 3G and 4G signal for best results by turning the LTE off in the carrier settings of your device.

**iPhone:** Need to download third party app.

**Android:** Settings > About Phone > Status or Network > Signal Strength or Network Type and Strength (exact options/wording depends on phone model).

**Note:** Turn off your cell phone’s WiFi to ensure you are checking the cellular connection. The dBm reading will be refreshed every 30-60 seconds. Want faster results? Once you have a reading, turn on airplane mode. Wait 15 seconds. Turn off airplane mode. The signal strength reading is refreshed.

Make sure the following things and tools are prepared and ready for your installation. You will need:
- 2–3 hours
- 2 people (a person to help with antenna calibration)
- Drill (if routing cable through wall)
- Recommended: Power Strip with surge protection
We **STRONGLY** recommend doing a test installation before finalizing the installation. Doing a test installation of your cell phone booster ensures that you will get the optimal performance from your system.

### Step 1: Measure the Signal Strength Inside your Home

- Test your current signal strength in multiple locations throughout the home
- Record the current signal strength in the table provided for reference

<table>
<thead>
<tr>
<th>No</th>
<th>Location</th>
<th>Record(dBm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>

</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Test** ➔ **Record**

### Step 2: Select the Location for the Inside Antenna

- Should have access to a power outlet
- The indoor unit contains an omni-directional antenna. Choosing a central location in your home will help to maximize your coverage area.
1. This is the most critical step and will determine the overall performance of the booster system.

2. Using the same method described in Step 1, walk around the outside of your home and test the signal strength. Determine where you have the strongest signal (the dBm reading is closest to zero).

3. Generally, the strongest signal will be located on the side of your home facing the nearest cell tower. Keep in mind, the signal strength at ground level may be different from the signal strength at or above the roofline due to obstructions (trees, other buildings, etc.) that block the incoming signal. In most situations, the strongest signal is found about 15 feet above the ground on the side of your home facing the nearest cell tower.

**Caution**

- The height of the outside antenna should never exceed the highest point of your home. This is a precaution against damage and safety concerns caused by lightning strikes to the outside unit.
- In order to achieve the best performance, try to maximize the distance between the inside and outside antenna.
- Ensure that the outside antenna is pointed away from where you plan to install the inside antenna. Self-oscillation may occur if the outside antenna is pointed over the location of the inside antenna.

<table>
<thead>
<tr>
<th>No</th>
<th>Location</th>
<th>Record(dBm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>

<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Step 4: Temporarily Mount the Outside Unit

Use one of the three options to mount the outside unit on your roof on the side of the house with the strongest signal.

In order to achieve the best signal coverage effect, there is a certain distance requirement between the indoor and outdoor units. Make sure the inside and outside units are facing away from each other.

**Minimum Required Separation Distance Between Indoor and Outdoor Unit:**
- 20 ft (6 meters) horizontal distance
- 13 ft (4 meters) vertical distance (As far as possible)

Make sure to meet the Minimum Separation Requirements while at the same time mounting the outside unit in the location with the strongest signal.
Step 5: Introduce (Route) Cables Into Room Through Window

Attention: Don’t kink the cable! Avoid excessive and extreme bending of the cable in order to prevent damage and loss of function.

Step 6: Connect the System

1. Connect the coax cable to the port on the outside unit.

2. Connect the other end of the coax cable to the inside unit.

3. Plug in the power adaptor and connect it to the nearest power outlet (surge protector recommended).
Step 7: Evaluate the Effects

- Now that the booster is up-and-running, re-test the signal strength inside your home at the same locations from Step 1. If the number is higher (dBm reading is closer to zero) than the original reading, your booster is working.
- If your signal is not stronger, check the LED lights on the booster and refer to the “Quick Troubleshooting” section at the end of the manual.

Decibel Gain vs. Power Amplification/Distance/Coverage area

<table>
<thead>
<tr>
<th>Decibel Gain</th>
<th>Power Amplification</th>
<th>Distance Enhance(times)</th>
<th>Coverage Enhance(times)</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>4</td>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>10</td>

<tr>
<td>30</td>
<td>1000</td>
<td>32</td>
<td>900</td>
</tr>
<tr>
<td>40</td>
<td>10000</td>
<td>80</td>
<td>6000</td>
</tr>
</tbody>
</table>

**Note:** Decibel Gain and Power Amplification may vary depending on the specifics of your situation. Different building materials and other obstructions in your home will result in different outcomes.
Once you have tested the performance of the signal booster and made all necessary adjustments, it’s time to finalize the installation.

**Outdoor Unit Installation**

Make sure that the outside unit is mounted at least 3 feet away from any other metallic objects or windows.

Option A: Outside Roof Pole Mount (Best Choice)

Use an existing pole or the pole provided to mount the outdoor unit in the optimal signal location. Use the picture for reference.
Option B: Mounting on Side of Wall (Second Choice)
Use a wire clamp to secure the inside antenna to the desired location. The antenna needs to be vertical, and should not be mounted horizontally.

Step 10: Finalizing and Securing Cable Route

- Find the best route for the cable. Follow the lines of your home to hide the cable in eaves or between the soffit and the exterior wall.
- If needed, cable clips can be purchased at most hardware stores.
Correct functioning:
• Power Light should be solid green
• When you turn on the booster, the Status Light “ALARM” will turn red and then turn off.

Incorrect Functioning: (Please see the Troubleshooting Guide for further details)
• Flashing Power Light, or Power Light is off. Please contact technical support.
• The Status Light “ALARM” indicates the condition of the booster, as follows:
  1. Solid Red= self-oscillation is occurring. Turn off the booster and ensure proper installation by re-checking each step in the manual. Ensure that the Minimum Separation Requirements have been met. Make sure that the outdoor antenna and the indoor antenna are not facing each other, that is, make sure that the outdoor antenna is not positioned such that it is pointing towards/over the inside antenna.
  2. Solid Green= the cable from the inside unit to the outside unit is not connected properly. Ensure a secure connection on both ends, with no obvious kinks in the cable, and try again.

Weather Conditions:
The outside unit, which includes the outside antenna and the integrated amplifier, is waterproof and designed to function regardless of rain, snow, or fog. However, extreme temperatures may cause problems with performance. Optimal booster functions will occur from -31F (-35C) to 158F (70C). If the outside temperature is beyond this range, the booster will automatically reduce output power to avoid damage.
Trouble Shooting: No Signal Improvement

Step 1. Check power. Ensure the indoor unit is plugged in and the LED Power Light is green.

Step 2. Check cable connections. Ensure the indoor and outdoor units are securely connected to the coax cable. If the cable from the inside unit to the outside unit is not connected properly, the Status Light “ALARM” on the indoor unit should be off.

Step 3. Double check the location of outdoor and indoor units. Make sure that the Minimum Separation Requirements have been met. Make sure that the outside antenna is not pointed towards the inside antenna.

Minimum Required Separation Distance Between Indoor and Outdoor Unit:
Horizontal Distance = 20 feet (6 meters)
Vertical Distance = 13 feet (4 meters) (As far as possible)

Step 4. Check incoming signal level at outdoor unit position. Usage of a booster is not recommend when the outdoor signal is less than -110dbm(3G/1x) or -120dBm(4G/LTE).

WARRANTY

The Outdoor Unit and Indoor Unit are covered under a three-year product warranty for failures or defects that result from craftsmanship and/or materials. Dated proof of purchase should be retained for use in warranty cases. Contact the retailer/reseller directly with any warranty issues, or alternatively contact the manufacturer in cases where the reseller is no longer available to handle warranty claims. In cases where the reseller is unavailable, the product may be returned to the manufacturer at the consumer’s expense, with a dated proof of purchase and a return authorization letter which can be attained by contacting SolidRF.

This warranty does not apply to any signal booster components determined by SolidRF to have been subjected to misuse, abuse, neglect, tampering, or mishandling that result in damages to the physical or electronic properties of the product. Refurbished products that have been recertified to conform to product specifications may be used for product replacements.

DISCLAIMER: The information provided by SolidRF is believed to be complete and accurate, to the best of our knowledge. However, no responsibility is assumed by SolidRF for any business or personal losses arising from the use of the information herein contained, or for any infringements of patents or other rights of third parties that may result from its use.
To uphold network protection standards and ensure compliance, all active cellular devices must maintain a separation distance of at least six feet between the inside unit antenna and outside unit antenna and at least four feet of separation distance from the inside unit. Use only the power supply provided in this package. Use of a non-SolidRF product or accessory may result in damage to the equipment or components of the equipment. The inside unit is designed for use in an indoor, temperature-controlled environment (less than 100 degrees Fahrenheit). It is not intended for use in attics or similar locations where temperatures may be in excess of that range.

RF Safety Warning: Any antenna used with this device must be located at least 8 inches from all persons.

This is a CONSUMER device.

BEFORE USE, you MUST REGISTER THIS DEVICE with your wireless provider and have your provider’s consent. Most wireless providers consent to the use of signal boosters. Some providers may not consent to the use of this device on their network. If you are unsure, contact your provider.

In Canada, BEFORE USE you must meet all requirements set out in ISED CPC-2-1-05. You MUST operate this device with approved antennas and cables as specified by the manufacturer. Antennas MUST be installed at least 20 cm (8 inches) from (i.e., MUST NOT be installed within 20 cm of) any person.

You MUST cease operating this device immediately if requested by the FCC (or ISED in Canada) or licensed wireless service provider.

WARNING. E911 location information may not be provided or may be inaccurate for calls served by using this device.

This device complies with Part 15 of FCC rules. Operation is subject to two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation. Changes or modifications not expressly approved by SolidRF could void the authority to operate this equipment.

FOR MORE INFORMATION ON REGISTERING YOUR SIGNAL BOOSTER WITH YOUR WIRELESS PROVIDER, PLEASE SEE BELOW:

T-Mobile/MetroPCS: https://support.t-mobile.com/docs/DOC-9827
AT&T: https://securec45.securewebsession.com/attsignalbooster.com/
